

HSE Platform — Client Feedback Action Plan

Prepared based on the client meeting feedback (Mobile App + Web Interface). Each item below has been checked against the current codebase to confirm scope, root cause, and whether it is ready to build or blocked on external input.

Mobile App Changes

1. Add a Description field in the Checklist *[Ready to build]*

Not present anywhere today — backend table (checklist_templates), FrontendNew type, and mobile type all lack a description field.

Scope: add DB column + migration, thread through backend/app/controllers/checklists.py, update ChecklistTemplate type in FrontendNew and mobile, render in ChecklistPage.tsx and SafetyChecklistScreen.tsx.

2. Home tab — final names for boxes/sections *[Blocked — pending Mr. Sarim]*

No code work possible until Mr. Sarim provides final naming. Will implement as a straight label update once received.

3. Rename Risk to Hazard throughout the application *[Needs scope confirmation]*

"Risk" is used two different ways in the app, so a blanket rename is not safe:

- Genuine risk-scoring/matrix features (RiskPage.tsx, dashboard risk trend, contractor_risk_score) — real risk-management terminology, likely should stay as "Risk".
- Mislabeled hazard flows — the worker "Report Risk" screen actually reports hazards (uses hazardService + hazard categories) but is labeled "Risk"; similarly the supervisor "Risk Register"/"Risk Management" screens are ambiguous.

Recommendation: rename the worker "Report Risk" flow to "Report Hazard" now (data already matches hazard model). Confirm with client whether supervisor Risk Register/RiskPage should also be renamed, or are meant to stay as risk-management features.

4. Common backend for Mobile App + Web Interface *[Ready to build]*

There is only one FastAPI backend already — the issue is three inconsistent client configs, not separate backends:

Client	Config file	Base URL
Mobile (generic/supervisor)	mobile/src/constants/config.ts	port 8000, emulator loopback IP
Mobile (worker)	mobile/src/worker/constants/config.ts	port 8000, hardcoded LAN/Azure IP
Web (FrontendNew)	FrontendNew/.env — VITE_BACKEND_URL	port 8080

Port mismatch (8000 vs 8080) needs verifying against how the backend actually runs in each environment, then centralize into a single env-driven config used by all three clients.

5. Display all applicable user roles + workflows in Mobile App *[Ready to build]*

Mobile login currently offers 4 roles: manager, supervisor, worker, auditor.

Auditor screens already exist (mobile/src/auditor/screens — Assigned Audits, Audit Calendar, Audit Checklist, Audit Detail) but AppNavigator.tsx has no auditor branch, so it silently falls into the worker stack — built but unreachable today. Quick fix: wire the auditor branch into navigation.

Deeper issue: role naming differs across layers (mobile: manager/worker/auditor vs. backend app_roles: admin/safety_manager/operator/viewer vs. FrontendNew checks: 'HSE Manager'/'Admin'). Recommend

reconciling to one source of truth for role names so all applicable roles/workflows can be listed consistently.

Web Interface Changes

6. Contractor Risk Score is incorrect *[Ready to build — root cause found]*

Two separate implementations of the same formula exist: `backend/app/controllers/dashboard.py` (lines 285-315) and `backend/app/controllers/vendor.py` (lines 250-287). Each independently queries incident and employee counts with slightly different joins, so the two pages can legitimately show different scores for the same contractor.

Fix: extract one shared calculation function/service; have both controllers call it so dashboard and vendor page always agree.

7. Assets Data *[Blocked — pending Abhishek]*

No code work until data is received. Once it arrives, will confirm target schema and import method before building the import path.

8. Duplicate Compliance box *[Already fixed — needs verification]*

Commit `c2a06e2` (2026-07-20) already removed the duplicate Compliance Score / Legal Register Coverage / Audit Readiness cards from `ComplianceDashboard.tsx`. Current code shows a single, unique row of 5 cards — no duplicates found.

Recommend confirming with client whether their screenshot predates this fix, or their deployed environment simply needs a redeploy of the latest main branch.

9. Injury Category and Type of Injury master list *[Partially blocked — pending Mr. Sarim]*

Final values must come from Mr. Sarim, but a deeper existing bug is worth flagging regardless: these are not real master lists today — they are derived by grouping free-text `immediate_cause` / `root_cause` columns (`backend/app/controllers/analytics.py`, lines 176-216), so charts reflect whatever string each reporter typed, not a controlled taxonomy.

Once Sarim's values arrive: add a real master-list table (same pattern as the existing `hazard_categories` table), add structured dropdowns to incident forms (mobile + `FrontendNew`), and update analytics grouping to use the new columns.

10. Checklist Intelligence — rename "Guide" to "Checklist Overview", fix Settings button *[Needs client clarification]*

No "Checklist Intelligence" feature or "Guide" label exists anywhere in the current codebase, and there is no Settings button inside the checklist feature.

Git history shows a sidebar item was previously named "Guide" and was already renamed to "Checklists" in commits `c598def` and `541c18a`.

Recommend confirming which screen/screenshot the client is referencing — likely a stale reference from before that rename, or a mockup not yet merged into main.

Suggested Priority Order

- **Ready now, no blockers:** #6 Contractor risk score fix, #5 auditor navigation wiring, #1 Checklist description field, #4 backend URL config, #3 worker "Report Hazard" rename
- **Needs quick client clarification first:** #10 Checklist Intelligence (which screen?), #3 supervisor-side Risk screens (rename or not?), #8 confirm already fixed
- **Blocked on external input:** #2 Mr. Sarim (Home tab names), #7 Abhishek (assets data), #9 Mr. Sarim (injury values)

Pending Inputs

Item	Owner
Final names for Home tab boxes/sections	Mr. Sarim
Injury Category and Type of Injury values	Mr. Sarim
Assets Data	Abhishek

Remarks: the above action items are based on the meeting discussion and handwritten notes, cross-checked against the current state of the codebase. Please review and let us know if any requirement, clarification, or action item has been missed.
