

HSE Intelligence Platform

Role-Based Workflow Lifecycle

Worker • Supervisor • HSE Manager • Auditor

This document describes how each role uses the platform end-to-end: which app they use, what they can do, and how work moves between roles until it is closed.

1. Roles at a Glance

Role	App	Primary Responsibility
HSE Manager	Mobile App	Creates checklist templates; gives final approval on incidents, CAPA actions and permits
Worker	Mobile App	Fills and submits checklists; reports incidents, near-misses, unsafe acts and hazards; rec
Supervisor	Mobile App	Acknowledges and reviews worker reports; approves/escalates; manages team, shift and
Auditor	Mobile App	Conducts scheduled audits; verifies permits and hazard-register entries after manager ap
All Roles	Web App	Review, validate and dashboard only — no data entry happens here

Key principle: the Web App is a review layer only. Every piece of field data — checklists, incidents, near-misses, unsafe acts, hazards and permits — is created and actioned on the Mobile App. The Web App is where an HSE Manager reviews what came in and gives final sign-off.

2. Checklist Lifecycle

Manager	Creates a checklist template Names it, writes the items/questions, and chooses who submits it and who validates it (mobile app)
Worker	Fills out the checklist Sees only the checklists assigned to their role; answers each item Yes/No with an optional remark
Supervisor	Fills out their own checklists Same mechanism as Worker, for supervisor-specific checklist types (e.g. shift handover)
Web App	Reviews the submission HSE Manager / Admin sees it in the Checklist Review screen once status = "submitted"
Manager	Approves or rejects Decision recorded; status becomes "validated" or "rejected"

Status values: draft → submitted → validated / rejected

3. Incident Lifecycle

Worker	Reports the incident Type, location, description, severity, injury details, photos (mobile app)
Supervisor	Acknowledges Confirms they have seen the report
Supervisor	Investigates High/critical severity escalates straight to Manager; otherwise moves to pending approval
Manager	Approves or sends back Approve moves it toward closure; reject sends it back to the Supervisor for further investigation
Manager	Closes Final closure once corrective actions are in place

Status values: reported → acknowledged → (escalated | pending_approval) → closed (*reject path returns to under_investigation*)

Auditor does not take part in the incident workflow.

4. Near-Miss, Unsafe Act & Risk Report Lifecycle

Identical chain for all three report types:

Worker

Reports

Near-miss, unsafe act observed, or a risk/hazard spotted in the field

Supervisor

Acknowledges & investigates

Same escalation rule as incidents: high/critical severity goes straight to Manager

Manager

Approves or sends back

Approve → ready for closure; reject → back to Supervisor

Manager

Closes

Final closure

Auditor does not take part in this workflow either.

5. Permit-to-Work Lifecycle

Worker	Requests a permit 4-step form: permit type, site & schedule, safety gear, risk assessment
Supervisor	Acknowledges Confirms the request has been seen
Manager	Approves or rejects Approve activates the permit on site; reject closes the request
Auditor	Verifies Spot-checks approved, active permits and records a verification result

Status values: requested → acknowledged → approved (permit becomes Active) | rejected → auditor-verified

6. Hazard Register Lifecycle

Worker	Logs a field hazard Worker or Supervisor records a hazard observed on site
Supervisor	Reviews Moves it to under review, controlled, or closed, and records the controls put in place
Auditor	Verifies Checks open / under-review hazards and records a verification note

Status values: open → under_review → controlled / closed (*auditor verification is a note, not a status change*)

7. Where the Auditor Fits In

The Auditor does not take part in the day-to-day Worker → Supervisor → Manager reporting chain (incidents, near-misses, unsafe acts, risk reports). Their role is independent verification, *after the fact*:

- Runs scheduled audits (assigned audits, audit calendar, audit checklist)
- Verifies permits once a Manager has approved them
- Verifies hazard-register entries independently of the Supervisor's review

8. The Web App's Role

Across every workflow above, the Web App's job stays the same: give the HSE Manager / Admin a single place to see what has come in from the field, and to approve, reject, or dashboard it. No checklist, incident, near-miss, unsafe act, risk report, permit, or hazard is ever created on the Web App — creation always starts on the Mobile App, in the field.

Prepared from the current implementation of the HSE Intelligence Platform codebase.
